1. INTRODUCTION

The Generic Sensor Format (GSF) library contains functions for creating and accessing multibeam and single-beam sonar data that have been stored in a generic byte stream format corresponding to the sequential encapsulation described in the Generic Sensor Format Specification. This specification defines a set of ten record types that are used to store bathymetric data.

This document is derived from documentation within the GSFlib source code, primarily the header file, `gsf.h`. The intent is to present that information in a more accessible, organized form and to describe the library's design and implementation. Because the information presented herein is derived from the source code, the code itself should be the primary reference for application developers.

1.1 Implementation Concept

The GSF library (gsflib) is a "thin" layer of software that transfers data between the data format described in the specification and a standardized set of data structures. This is necessary because the specified data format is a byte stream of data containing records of arbitrary length that have been extensively optimized for compactness and is not easily manipulated. The organization of the data structures populated by GSFlib is for the developer's convenience and presents the data in a uniform manner with a consistent set of physical units. There is a one-to-one correspondence between the record types defined in the specification and the data structures made available through the library.

Figure 1-1 illustrates the GSF library functions. There are three functional categories in the library routines: those that provide access to the data when stored on disk, those that perform utility operations and those that provide information about the data. The access functions, which translate between the memory-based data structures and the byte-stream data format, include operations to open and close, read and write to data files and seek functions to access data by time and record type.

Utility functions include routines that copy data structures, free memory, translate processing parameters into a more accessible form, and provide the programmer with access to the scale factors used to optimize the storage of ping arrays. Processing parameters document the extent to which data have been processed and the values of any correctors or offsets that have been applied to the data. Access to processing parameters is necessary when they are required or need to be updated. Scale factor information defines how the data are packaged into the GSF data files. They are automatically applied to read operations and need to be manipulated only when the application is writing data to disk

Informational functions provide a variety of facts about the data. These functions provide capabilities such as:

- describing error conditions,

- returning the relative location of the file pointer within the file,
- providing counts of the number of records of a given type,
- discriminating between starboard and port-directed beams in dual transducer configurations
- Providing beam widths for the data being processed.
- Providing the name of the sensor

It should be noted that for some sonars this beam width information is not stored within the data but is provided by lookup tables within the library source code.

The GSF byte stream is a sequentially oriented file but the library provides for direct access to the data via an auxiliary index file. Upon opening a data file for direct access, the disk is inspected for an index file that corresponds to the data file being opened. If there is no index file, one is created. The index file provides direct access to any record in the data file. The creation and maintenance of the index file is transparent to both the application developer and to the user. The normal sequence of events is for the data file to be written sequentially and for the index file to be created by the first program that needs to examine it using direct access. At this time, the index file format is not a part of the GSF data specification but is defined only within the library.

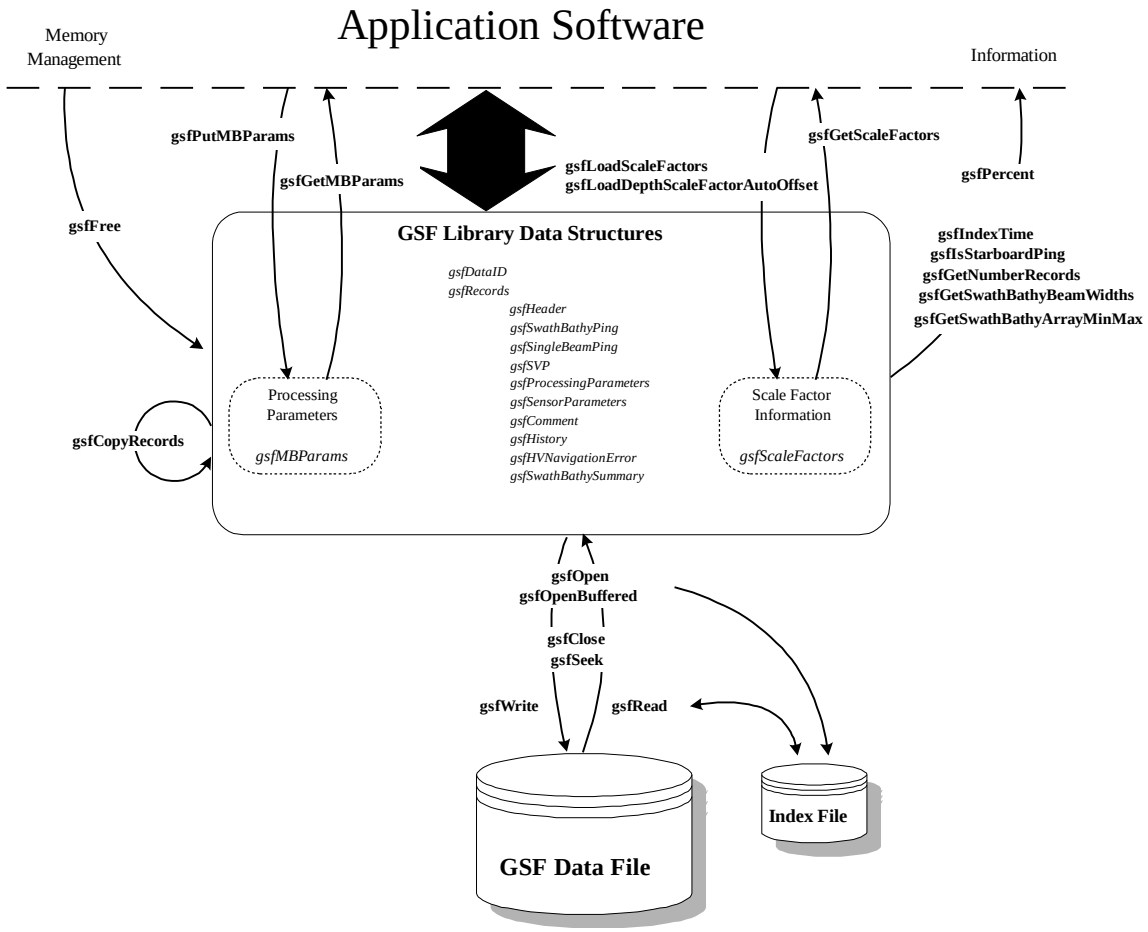

Figure 1-1 GSFLib Functions

1.2 Development History

J. Scott Ferguson and Brad Ward of SAIC and Daniel Chayes of the Naval Research Lab developed the GSF specification. The Defense Mapping Agency supported its development and it was first published on 31 March 1994. The initial author of the GSF library is Shannon Byrne of Leidos (formerly SAIC). The library was first released on 3 May 1994. The U.S. Naval Oceanographic Office (NAVOCEANO) and Naval Sea Systems Command (NAVSEA) supported the development of this library. NAVOCEANO also provided significant direction and feedback during the library's development and initial deployment. After deployment, the GSF Working Group was formed. This group discusses issues relative to the specification and the library, provides direction for GSF development and acts as a configuration control board to accept updates. The working group exchanges technical information mostly via email. The GSF mailing list can be subscribed to by filling out the form located here: https://www.leidos.com/maritime/gsf. Both the specification and the GSF library are maintained under configuration control by Leidos with input from members of the GSF working group.

The library's release history is as follows:

Release Date	Version ID	Description
03 May 1994	GSF-v01.00	Initial Release.
14 Aug 1995	GSF-v01.01	Direct and sequential access now works through common **gsfRead** and **gsfWrite** API. All pointers to dynamically allocated memory are now maintained by the library.
22 Dec 1995	GSF-v01.02	Added **gsfGetMBParams**, **gsfPutMBParams, gsfIsStarboardPing**, and **gsfGetSwathBathyBeamWidths**. Also added *GSF_APPEND* as a file access mode, and modified *GSF_CREATE* access mode so that files can be updated (read and written).
20 Aug 1996	GSF-v01.03	Added support for single beam echosounders. Added **gsfStringError** function.
24 Mar 1997	GSF-v01.04	Added support for RESON 8101 sonar and enhanced support for "classic" Seabeam sonar. Increased the maximum record size from 4 kbytes to 32 kbytes.
04 Sep 1998	GSF-v01.06	Added support for SeaBeam 2100 series multibeam sonars and for Elac Bottomchart MkII sonars. Minor enhancements to code portability.
12 Nov 1998	GSF-v01.07	Defined a new GSF navigation error record *gsfHVNavigationError* that replaces the currently defined navigation error record *gsfNavigationError*. Modified encode of the existing error array subrecords (depth_error, across_track_error, and along_track_error) as two byte quantities. Added two new array subrecords to the GSF swath bathymetry ping data structure, namely horizontal error and vertical error. Modified the **gsfPrintError** function so that it calls the **gsfStringError** function. **gsfStringError** function expanded so that all defined error conditions are handled.
07 Oct 1999	GSF-v01.08	Added support for Simrad multibeam models EM-3000, EM-1002 and EM-300, as well as added a new compressed SASS (*gsfCmpSassSpecific*) specific data structure. Added two new functions **gsfGetSwathBathyArrayMinMax** and **gsfLoadDepthScaleFactorAutoOffset** in support of signed depth. Also added processing in the **gsfGetSwathBathyBeamWidths** function to return the beam width values specified within the EM-3000 series data formats. Increased the *GSF_MAX_PROCESSING_PARAMETERS* macro from sixty-four to one hundred and twenty-eight and the *GSF_MAX_SENSOR_PARAMETERS* macro from thirty-two to one hundred and twenty-eight. Modified **gsfPutMBParameters** function to allow processing parameters to contain the appropriate designator for the vertical datum.

12 Oct 1999	GSF-v01.09	Updated the contents of the compressed SASS (gsfCmpSassSpecific) specific subrecord. Added a comment block to the compressed SASS specific subrecord definition to describe the mapping between SASS and GSF data. Included annotations informing that the gsfCmpSassSpecific data structure is intended to replace the gsfTypeIIISpecific data structure in a future release. All new coding should use the gsfCmpSassSpecific data structure.
20 Oct 2000	GSF-v01.10	Enhancements for index file portability between big and little endian-based host machines. Updates to source code for minor bug fixes.
16 Jan 2001	GSF-v01.11	Updated the contents of the gsfEM3RunTime data structure to include separate elements for port and starboard swath width and for port and starboard coverage sectors. Updated the contents of the gsfEM3RunTime data structure to include the HiLo frequency absorption coefficient ratio. Added checks for LINUX specific defines before defining timespec structure. Added support for more tidal datums. Fixed errors in decoding of HV Navigation Error records.
29 Mar 2002	GSF-v02.00	Modified to support access from c++ applications, address file sharing problems on multiprocessor Linux configurations, resolve compile macros used for Win32, resolved several minor bug fixes, remove unused automatic variables, add support for the Simrad EM120 sonar, reserve subrecord IDs for the latest datagram format for Reson 8101, 8111, 8125, 8150, and 8160 sonar systems, and ensure that a string terminating NULL is applied when strncpy is used.
08 Jul 2002	GSF-v02.01	Added gsfAttitude record to allow storage of full time series of attitude data. Added a new sensor specific subrecord for Reson 8101, 8111, 8125, 8150, and 8160 sonar systems. Expanded the gsfMBOffsets structure to include motion sensor offsets. Updated gsfGetMBParams and gsfPutMBParams to encode and decode new motion sensor offsets in the process_parameters record.
20 Jun 2003	GSF-v02.02	Added support for bathymetric receive beam time series intensity data. Added sensor-specific single-beam information to the multibeam sensor specific subrecords.
29 Dec 2004	GSF-v02.03	Fixed memory leaks, fixed encoding and decoding of 1-byte BRB intensity values, updated gsfLoadDepthScaleFactorAutoOffset to vary the offset interval based on precision, added beam spacing to Reson 8100 sensor-specific subrecord, reserved sensor Ids for Simrad EM3002, EM3002D, and EM3000D, added sensor specific support for Reson Navisound singlebeam, added copy of vertical_error and horizontal_error arrays in

		gsfCopyRecords, and added definitions for RTG position type to gsfHVNavigationError record.
30 Jun 2006	GSF-v2.04	Added support for EM121A data received via Kongsberg SIS. Added support for EM3000D and EM3002D in gsfIsStarboard ping function. Added new service to allow calling programs to register a callback function for reporting progress of index file creation. Updated gsfCopyRecords to copy all HV Nav Error data from source to target data structure. Updates to support compilation on 64-bit architectures, and compilation on MAC OSX operating system.
09 Mar 2007	GSF-v2.05	Added support for bathymetry data from the GeoAcoustics Ltd. GS+ Interferrometric side-scan sonar system. Reserve sub-record IDs for the Kongsberg EM122, EM302, and EM710 systems.
04 Sep 2007	GSF-v2.06, GSF-v2.07	Added support for the Kongsberg EM122, EM302, and EM710 multibeam systems. Added application level control over the field size to be used for a subset of the beam array subrecords. Improved error checking in gsfLoadScaleFactor(). Fixed a problem in DecodeSignedByteArray that was only an issue on the SGI platform.
03 Dec 2007	GSF-v2.08	Modified the approach used to parse the beam array subrecords to no longer depend on the compression flag field of the scale factor subrecord for determining the field size. This dependency on the compression flag field was added in GSFv2.06 on the premise that a default value of zero could (always) be expected.
30 Jan 2008	GSF-v2.09	Added support for Klein 5410 Bathymetric Sidescan.
20 Mar 2009	GSF-v03.01	Added support for the Reson 7125 and EM2000. Added fields for height, separation, and gps tide corrector to the gsfSwathBathyPing record. Added new processing parameter record values: vessel_type, full_raw_data, msb_applied_to_attitude, heave_removed_from gps_tc. Added new sensor ids for EM3 sensors to differentiate between data logged from the depth datagram and the raw range and beam angle datagram.
24 Sep 2010	GSF-v03.02	Added support for KM2040. Added support for Imagenex Delta-T. Add new query functions to provide calling applications with a simple means to determine what data are contained in the GSF file and what processing operations can be supported given the parameters available in the input file. Added separation uncertainty field to the Navigation uncertainty record. Several bugs resolved.

24 Sep 2011	GSF-v03.03	Added support for Kongsberg EM12 and R2Sonic
18 April 2012	GSF-v03.04	Several bugs resolved.
30 March 2014	GSF-v03.05	Geodetic functions added. Added new ping subarray for sonar's vertical uncertainty. Added support for files larger than 2 gigabytes in size. Added support for different number of multibeam transmitters and receivers. Some bugs resolved.
30 June 2014	GSF-v03.06	Minor update to correct large file support issues new to GSF-v03.06.
31 October 2016	GSF-v03.07	Minor update to correct appending to GSF index files.
2 October 2018	GSF-v03.08	Added support for Reson T Series multibeam systems.

1.3 Restrictions and Limitations

The following restrictions or limitations apply to the GSFlib code.

- The library assumes the host computer uses the ASCII character set.
- The library is written in the C language and assumes that the type `short` is 16 bits, and that the type `int` is 32 bits.
- The library provides access to individual data files only and does not support the development of metadata or transmittal files. It should be noted, however, that many of the data items recorded in the files' summary and parameter records may be used to populate metadata records.
- Data compression flags are maintained within the ping scale factors subrecord but data compression is not supported.
- The index function creates separate index files that make assumptions about the file naming convention. The library names the index file the same as the data file name but replaces the third to the last character with an "n". This is because the files are expected to be named using a file naming convention adhered to within NAVOCEANO for data collected by their Integrated Survey Systems (ISS and ISS-60). No protection exists for the case where a GSF data file already has an "n" in the third to the last character. As of GSFv03.05, the GSF library supports files larger than 2 gigabytes in size. As of GSFv03.05, the format of the index files has changed to accommodate 8-byte file offset pointers. When an older format index file is encountered by the new library, the index file will automatically be recreated. A GSFv03.05 format index file will not be usable by older versions of library.
- Time is recorded in precise form only with fractional seconds included in all time fields. The beginning of the epoch is required to be midnight of 1 January 1970, thus data recorded prior to this date is not supported. All times in GSF are required to be relative to UTC.
- The only horizontal datum supported is "WGS-84"; supported tidal datums include "UNKNOWN", "MLLW", "MLW", "ALAT", "ESLW", "ISLW", "LAT", "LLW", "LNLW", "LWD", "MLHW", "MLLWS",

"MLWN", "MSL", "ALLW", "LNT", "AMLWS", "AMLLW", "MLWS", "AMSL", "AMLW", "AISLW", and "ALLWS". This is a limitation with the data structure *gsfMBParams* which represents horizontal and vertical datums as integers. Only these datums have integer definitions in `gsf.h`.

- Data record compression is not supported.
- The current version of GSFlib library does provide text string translations for all error code returns; however, all definitions do not have unique values.
- The name of the *gsfSwathBathySummary* record implies that the data in this structure is specific to the Swath Bathy Ping Record. This is not the case; the data structure is implemented to represent the Summary Record as defined in the specification.

1.4 References

Generic Sensor Format Specification, 02 May 2014, Prepared for: Naval Oceanographic Office, Stennis Space Center, MS, by Leidos, 221 Third Street, Newport RI.

1.5 Distribution

The information in this document and the GSF library source code itself is unclassified and may be distributed without restriction. Copyright permission for the GSF sources is made available under the terms of LGPLv2.1. Releases of the GSF library are produced solely by Leidos. Leidos will receive and review source changes provided from contributors and review these with the GSF working group for consideration in future a future GSF release.

1.6 Sensors Supported

Multibeam echosounders

- Elac Bottomchart Mk II
- RESON SEABAT 9000 Series
- RESON 7125
- RESON 8101
- RESON 8111
- RESON 8124
- RESON 8125
- RESON 8150
- RESON 8160
- RESON T-SERIES (T-50, T-20)
- SeaBeam 2100 series

- Kongsberg EM12
- Kongsberg EM100
- Kongsberg EM121
- Kongsberg EM121A
- Kongsberg EM300
- Kongsberg EM950
- Kongsberg EM1000
- Kongsberg EM1002
- Kongsberg EM2000
- Kongsberg EM3000 and EM3000D
- Kongsberg EM120
- Kongsberg EM3002 and EM3002D
- Kongsberg EM122
- Kongsberg EM302
- Kongsberg EM710
- Kongsberg EM2040
- Imagenex Delta-T
- R2Sonic 2022
- R2Sonic 2024
- R2Sonic 2020

Interferrometric Side-Scan Systems

- SEAMAP
- GeoAcoustics GS+

Multibeam Archival Formats

- Compressed SASS

Single-beam Echosounders

- Odom Echotrac
- ODEC Bathy2000

- Reson Navisound

Single-beam Archival Formats

- MGD77
- BDB
- NOS HDB

Bathymetric Sidescan Systems

- Klein 5410

1.7 Computer Platforms Supported

The GSF library has been used on the following platforms:

- HP Series 7000 workstations running HPUX 9.0, 10.0, and 11.0
- PCs running IBM OS/2, versions 2.0, 3.0 and 4.0, LINUX (32 bit and 64 bit), and WINDOWS NT, 2000, XP, 7, 8
- Digital Alpha Workstation running Digital UNIX, version
- Silicon Graphics running IRIX 6.3
- Sun
- Mac OSX

In order to support files larger than two gigabytes, redefinitions of the standard functions fopen, stat, ftell, and fseek were made in gsf.c and gsf_indx.c. The function redefinitions are made in these .c files to avoid any un-intended redefinition affecting user application code. Compiler directives steer the redefinition of these functions for the appropriate underlying Operation System. The following combinations are supported: Windows using Microsoft Visual Studio and Mingw, Linux using gcc, and MacOS using gcc.

When compiling the source code in Linux, the –D_LARGEFILE_SOURCE flag must be used to provide access to the fopen64, stat64, ftello64, and fseeko64 functions. When compiling in Windows/mingW, these functions are available without this define. When compiling in Windows/MSC, the _ftelli64 and _fseeki64 functions are readily available.

1.8 Documentation Conventions

- References to GSF functions are **bolded**.
- References to GSF data structures or definitions are *italicized*.

- Function prototypes, function arguments and other references to C-language source code are in Courier type (e.g., `int`)

2. FUNCTION DEFINITIONS

The library function definitions in this section are in three functional categories, those used to access data, those used to perform utility functions, and those that provide information about the data.

2.1 Access Functions

Access functions include those used to open and close data files, read and write data and place the file pointer as various locations within the file.

2.1.1 Function: gsfOpen

Usage:

```
int gsfOpen(const char *filename,
            const int   mode    ,
            int        *handle  )
```

Description:

This function attempts to open a GSF data file. If the file exists and is opened for read-only or for update, the GSF header is read to confirm that this is a GSF data file. If the file is opened for creation, the GSF header containing the version number of the software library is written into the header. This function passes an integer handle back to the calling application. The handle is used for all further access to the file. **gsfOpen** explicitly sets stream buffering to the value specified by *GSF_STREAM_BUF_SIZE*. The internal file table is searched for an available entry whose name matches that specified in the argument list, if no match is found, then the first available entry is used. Up to *GSF_MAX_OPEN_FILES* files may be open by an application at a time.

If a file is opened as *GSF_READONLY_INDEX* or *GSF_UPDATE_INDEX* a corresponding index file is expected to exist. If the index file exists, its contents are examined to determine if the GSF file has increased in size since the index file was created. If not, subsequent file accesses use the index file. If the index file does not exist, the **gsfOpen** function automatically creates it. If the GSF file is larger than that recorded in the index file, the index file is updated to correspond to the new records in the GSF file.

Inputs:

`filename` a fully qualified path to the GSF file to be opened

`mode` may have the following values:

GSF_READONLY open an existing file for read-only access

GSF_UPDATE open an existing file for reading and writing

GSF_CREATE create a new GSF file

GSF_READONLY_INDEX open an existing file for read only access with an index file

GSF_UPDATE_INDEX open an existing file for reading and writing with an index file

GSF_APPEND open an existing file for appending

`handle` a pointer to an integer to be assigned a handle which will be referenced for all future file access.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_ACCESS_MODE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_FOPEN_ERROR

GSF_READ_ERROR

GSF_SETVBUF_ERROR

GSF_TOO_MANY_OPEN_FILES

GSF_UNRECOGNIZED_FILE

GSF_OPEN_TEMP_FILE_FAILED

GSF_CORRUPT_INDEX_FILE_ERROR

GSF_INDEX_FILE_OPEN_ERROR

GSF_FILE_TELL_ERROR

GSF_MEMORY_ALLOCATION_FAILED

2.1.2 Function: gsfOpenBuffered

Usage:

```
int gsfOpenBuffered(const char *filename,
                    const int   mode,
                    int        *handle,
                    int         buf_size)
```

Description:

This function attempts to open a GSF data file. If the file exits and is opened read-only or for update, the GSF header is read to confirm that this is a GSF data file. If the file is opened for creation, the GSF header containing the version number of the software library is written into the header. This function passes an integer handle back to the calling application. The handle is used for all further access to the file. **gsfOpenBuffered** explicitly sets stream buffering to the value specified by the `buf_size` argument. The internal file table is searched for an available entry whose name matches that specified in the argument list, if no match is found, then the first available entry is used. Up to *GSF_MAX_OPEN_FILES* files may be open by an application at a time. **gsfOpenBuffered** performs identical processing to **gsfOpen** except that the caller is allowed to explicitly set the I/O buffer size.

If a file is opened as *GSF_READONLY_INDEX* or *GSF_UPDATE_INDEX,* a corresponding index file is expected to exist. If the index file exists, its contents are examined to determine if the GSF file has increased in size since the index file was created. If not, the index file is used for subsequent file accesses. If the index file does not exist, the **gsfOpenBuffered** function automatically creates it. If the GSF file is larger than that recorded in the index file, the index file is updated to correspond to the new records in the GSF file.

Inputs:

`filename` a fully qualified path to the GSF file to be opened

`mode` may have the following values:

GSF_READONLY open an existing file for read-only access

GSF_UPDATE open an existing file for reading and writing

GSF_CREATE create a new GSF file

GSF_READONLY_INDEX open an existing file for read-only access with an index file

GSF_UPDATE_INDEX open an existing file for reading and writing with an index file

GSF_APPEND open an existing file for appending

`handle` a pointer to an integer to be assigned a handle which will be referenced for all future file access.

`buf_size` an integer buffer size in bytes.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_ACCESS_MODE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_FOPEN_ERROR

GSF_READ_ERROR

GSF_SETVBUF_ERROR

GSF_TOO_MANY_OPEN_FILES

GSF_UNRECOGNIZED_FILE

GSF_OPEN_TEMP_FILE_FAILED

GSF_CORRUPT_INDEX_FILE_ERROR

GSF_INDEX_FILE_OPEN_ERROR

GSF_FILE_TELL_ERROR

GSF_MEMORY_ALLOCATION_FAILED

2.1.3 Function: gsfRead

Usage:

```
int gsfRead(int            handle,
            int            desiredRecord,
            gsfDataID     *dataID,
            gsfRecords    *rptr,
            unsigned char *buf,
            int            max_size)
```

Description:

gsfRead supports both direct and sequential access. If the file is opened for sequential access, this function reads the desired record from the GSF data file specified by the handle. Setting the `desiredRecord` argument to *GSF_NEXT_RECORD* reads the next record in the data file. The `desiredRecord` argument may be set to specify the record of interest, such as an SVP record. In this case, the file is read, skipping past intervening records. After locating the desired record, it is read and decoded from external to internal form. If the data contains the optional checksum, the checksum is verified. All of the fields of the *gsfDataID* structure, with the exception of the `record_number` field will be loaded with the values contained in the GSF record byte stream. For sequential access, the `record_number` field is undefined. The `buf` and `max_size` arguments are normally set to NULL, unless the calling application requires a copy of the GSF byte stream.

If the file is opened for direct access, then the combination of the `recordID` and the `record_number` fields of the `dataID` structure are used to uniquely identify the record of interest. The address for this record is retrieved from the index file, which was created on a previous call to **gsfOpen** or **gsfOpenBuffered**. If the record of interest is a ping record that needs new scale factors, the ping record containing the scale factors needed is read first, and then the ping record of interest is read. Direct access applications must set the `desiredRecord` argument equal to the `recordID` field in the *gsfDataID* structure.

Inputs:

`handle`	the handle to the file as provided by **gsfOpen or gsfOpenBuffered**
`desiredRecord`	the desired record or *GSF_NEXT_RECORD*
`dataID`	a pointer to a *gsfDataID* structure to be populated for the input record.
`rptr`	a pointer to a *gsfRecords* structure to be populated with the data from the input

	record in internal form.
`buf`	an optional pointer to caller memory to be populated with a copy of the GSF byte stream for this record.
`max_size`	an optional maximum size to copy into `buf`

Returns:

This function returns the number of bytes read if successful or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_BAD_FILE_HANDLE

GSF_CHECKSUM_FAILURE

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_HEADER_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_INSUFFICIENT_SIZE

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_READ_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_RECORD_SIZE_ERROR

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_RECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

GSF_QUALITY_FLAGS_DECODE_ERROR

2.1.4 Function: gsfWrite

Usage:

```
int gsfWrite(int         handle,
             gsfDataID  *id,
             gsfRecords *rptr)
```

Description:

gsfWrite encodes the data from internal to external form, and then writes the requested record into the file specified by handle, where handle is the value returned by either **gsfOpen or gsfOpenBuffered**. The record is written to the current file pointer for handle. An optional checksum may be computed and encoded with the data if the checksum flag is set in the *gsfDataID* structure. If the file is opened for sequential access (*GSF_CREATE*, or *GSF_UPDATE*) then the `recordID` field of the *gsfDataID* structure is used to specify the record to be written.

When opening the file for direct access (GSF_UPDATE_INDEX), the combination of the `recordID` and the `record_number` fields of the *gsfDataID* structure uniquely identify the record to write. The address of the record of interest is read from the index file and the file pointer is moved to this offset before the record is encoded and written to disk.

Inputs:

`handle` the handle for this file as returned by **gsfOpen**

`id` a pointer to a *gsfDataID* containing the record ID information for the record to write.

`rptr` a pointer to a *gsfRecords* structure from which to get the internal form of the record to be written to the file.

Returns:

This function returns the number of bytes written if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_ATTITUDE_RECORD_ENCODE_FAILED

GSF_BAD_FILE_HANDLE

GSF_COMMENT_RECORD_ENCODE_FAILED

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_HEADER_RECORD_ENCODE_FAILED

GSF_HISTORY_RECORD_ENCODE_FAILED

GSF_HV_NAV_ERROR_RECORD_ENCODE_FAILED

GSF_NAV_ERROR_RECORD_ENCODE_FAILED

GSF_PROCESS_PARAM_RECORD_ENCODE_FAILED

GSF_SENSOR_PARAM_RECORD_ENCODE_FAILED

GSF_SINGLE_BEAM_ENCODE_FAILED

GSF_SUMMARY_RECORD_ENCODE_FAILED

GSF_SVP_RECORD_ENCODE_FAILED

GSF_UNRECOGNIZED_RECORD_ID

GSF_UNRECOGNIZED_SENSOR_ID

GSF_WRITE_ERROR

GSF_ILLEGAL_SCALE_FACTOR_MULTIPLIER

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.1.5 Function: gsfSeek

Usage:

```
int gsfSeek(int handle,
            int option)
```

Description:

This function moves the file pointer for a previously opened GSF file.

Inputs:

`handle` the integer handle returned from **gsfOpen** or gsfOpenBuffered

`option` the desired action for moving the file pointer, where:

GSF_REWIND moves the pointer to first record in the file.

GSF_END_OF_FILE moves the pointer to the end of the file.

GSF_PREVIOUS_RECORD backup to the beginning of the record just written or just read.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_BAD_SEEK_OPTION

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

2.1.6 Function: gsfClose

Usage:

```
int gsfClose(const int handle)
```

Description:

This function closes a GSF file previously opened using **gsfOpen** or gsfOpenBuffered

Inputs:

`handle` the handle of the GSF file to be closed.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_CLOSE_ERROR

2.2 Utility Functions

Utility functions include those used to copy records, to free memory and to access multibeam processing parameters and scale factors.

2.2.1 Function: gsfCopyRecords

Usage:

```
int gsfCopyRecords (gsfRecords *target,
                    const gsfRecords *source)
```

Description:

This function copies all of the data contained in the source *gsfRecords* data structure to the target *gsfRecords* data structure. The target *must* be memset to zero before the first call to **gsfCopyRecords**. This function allocates dynamic memory that is NOT maintained by the library. The calling application must release the memory allocated by maintaining the target data structure as static data, or by using **gsfFree** to release the memory.

Inputs:

`target` a pointer to a *gsfRecords* data structure allocated by the calling application, into which the source data is to be copied.

`source` a pointer to a *gsfRecords* data structure allocated by the calling application, from which data is to be copied.

Returns:

This function returns zero if successful, or -1 if an error occurs. *gsfError* is set to indicate the error.

Error Conditions:

GSF_MEMORY_ALLOCATION_FAILED

2.2.2 Function: gsfFree

Usage:

```
void gsfFree (gsfRecords *rec)
```

Description:

This function frees all dynamically allocated memory from a *gsfRecords* data structure, and then clears all the data elements in the structure.

Inputs:

`rec` pointer to a *gsfRecords* data structure

Returns:

None

Error Conditions:

None

2.2.3 Function: gsfPutMBParams

Usage:

```
int gsfPutMBParams(const gsfMBParams *p,
                   gsfRecords  *rec,
                   int          handle,
                   int          numArrays)
```

Description:

This function moves swath bathymetry sonar processing parameters from internal form to "KEYWORD=VALUE" form. The internal form parameters are read from an *gsfMBParams* data structure maintained by the caller. The "KEYWORD=VALUE" form parameters are written into the *gsfProcessingParameters* structure of the *gsfRecords* data structure maintained by the caller. Parameters for up to two transmitter array modules and two receiver array modules are supported. If the user sets the 'number_of_transmitters' and 'number_of_receivers' elements in the *gsfMBParams* data structure in addition to the '`numArrays`' command line argument, the '`numArrays`' value will be ignored. If 'number_of_transmitters' and 'number_of_receivers' are equal to 0, then '`numArrays`' will be used to populate both these values in the GSF processing parameters record.

Inputs:

p	a pointer to the *gsfMBParams* data structure which contains the parameters in internal form.
rec	a pointer to the *gsfRecords* data structure into which the parameters are to be written in the "KEYWORD=VALUE" form.
handle	the integer handle to the file set by **gsfOpen** or gsfOpenBuffered
numArrays	the integer value specifying the number of pairs of arrays that need to have separate parameters tracked.

Returns:

This function returns zero if successful, or -1 if an error occurs. *gsfError* is set to indicate the error.

Error Conditions:

GSF_MEMORY_ALLOCATION_FAILED

GSF_PARAM_SIZE_FIXED

2.2.4 Function: gsfGetMBParams

Usage:

```
int gsfGetMBParams(const gsfRecords  *rec,
                   gsfMBParams *p,
                   int         *numArrays)
```

Description:

This function moves swath bathymetry sonar processing parameters from external form to internal form. The external "KEYWORD=VALUE" format parameters are read from a *gsfProcessingParameters* structure of the *gsfRecords* data structure maintained by the caller. Any parameter not described in a “KEYWORD=VALUE” format will be set to “GSF_UNKNOWN_PARAM_VALUE”. The internal form

parameters are written into a *gsfMBParams* data structure maintained by the caller. Parameters for up to two transmitters and two receivers are supported. The 'number_of_transmitters' and 'number_of_receivers' elements of the *gsfMBParams* data structure are set by determining the number of fields in the parameters for the transmitter(s) and receiver(s), respectively. The '`numArrays`' argument is set from the number of fields for the transmitter(s).

Inputs:

`rec`	a pointer to the *gsfRecords* data structure from which the parameters in "KEYWORD=VALUE" form are to be read.
`p`	a pointer to the *gsfMBParams* data structure which will be populated.
`numArrays`	the integer value specifying the number of pairs of arrays which need to have separate parameters tracked.

Returns:

This function returns zero if successful, or -1 if an error occurs. *gsfError* is set to indicate the error.

Error Conditions:

None.

2.2.5 Function: gsfStat

Usage:

```
int gsfStat(char *filename, long long *sz)
```

Description:

This function attempts to stat a GSF file. Supports 64 bit file size.

Inputs:

`filename`	A fully qualified path to the GSF file.
`sz`	A pointer to an 8 byte long long for return of a GSF file size from a stat64 call.

Returns:

This function returns zero if successful, or -1 if an error occurs.

Error Conditions:

GSF_FOPEN_ERROR

GSF_UNRECOGNIZED_FILE

2.2.6 Function: gsfLoadScaleFactor

Usage:

```
int gsfLoadScaleFactor(gsfScaleFactors *sf,
                       int             subrecordID,
                       char            c_flag,
                       double          precision,
                       int             offset)
```

Description:

gsfLoadScaleFactor is used to load the swath bathymetry ping record scale factor structure. This function allows the calling application to specify the precision and offset values used to scale the data from internal form (engineering units) to external form (scaled integer). This function need only be used by applications that are creating a new GSF file from some other data format, or by applications that are updating the numerical values of the beam arrays. In these cases, the application program needs to be aware of the desired data resolution for each beam array and the available dynamic range for each beam array. This is necessary to achieve the desired resolution while avoiding an overflow of the scaled dynamic range. The library does not monitor the scaled values for field level overflow, and no error value will be returned if an overflow occurs. This function should be called at least once for each beam array data type contained in your data, and must be called prior to calling **gsfWrite** by applications creating a new GSF file.

gsfLoadScaleFactor can be called for each beam array before each call to **gsfWrite** to achieve the proper field resolution for each ping record. **gsfLoadScaleFactor** populates the *gsfScaleFactors* sub-structure contained within the *gsfRecords* structure. **gsfWrite** will encode the optional gsfScaleFactors sub-record once at the beginning of the data file and again whenever the scale factor values change. Once written, the offset and precision for each beam array remain in effect for subsequent data records until the scale factors are changed. On encode from internal form to external form, each beam array value is scaled by adding the specified offset and multiplying by one over the specified precision, or:

$$scaled\_value = (beam\_value + offset) / precision$$

On decode from external form to internal form, the inverse operation is performed, or:

$$beam\_value = (scaled\_value / precision) - offset$$

Table 2-1 describes the storage available for each of the array values, and shows the dynamic range of the external form value after the offset and multiplier scaling values are applied. It should be noted that some of the beam arrays support more than one option for the field size. When first creating a GSF file, the calling application can specify the desired field size via the c_flag argument to the **gsfLoadScaleFactor** function. The default field size values for each beam array are listed in the table below. The field size is set by using one of the field size macros defined in gsf.h. Supported values include: GSF_FIELD_SIZE_DEFAULT, GSF_FIELD_SIZE_ONE, GSF_FIELD_SIZE_TWO, and GSF_FIELD_SIZE_FOUR. Once the field size has been set this value cannot be changed without rewriting the entire GSF file.

Table 2-1 GSF Beam Array Field Size Definitions

Array Subrecord	Data Representation	Size, bits	Scaled Dynamic Range
DEPTH	unsigned short (default)	16	0 to 65535
	unsigned int (option)	32	0 to 4294967295
NOMINAL_DEPTH	unsigned short (default)	16	0 to 65535
	unsigned int (option)	32	0 to 4294967295
ACROSS_TRACK	signed short (default)	16	-32768 to 32767
	signed int (option)	32	-2147483648 to 2147483647
ALONG_TRACK	signed short (default)	16	-32768 to 32767
	signed int (option)	32	-2147483648 to 2147483647
TRAVEL_TIME	unsigned short (default)	16	0 to 65535
	unsigned int (option)	32	0 to 4294967295
BEAM_ANGLE	signed short	16	-32768 to 32767
MEAN_CAL_AMPLITUDE	signed byte (default)	8	-128 to 127
	signed short (option)	16	-32768 to 32767
MEAN_REL_AMPLITUDE	unsigned byte (default)	8	0 to 255
	unsigned short (option)	16	0 to 65535

ECHO_WIDTH	unsigned byte (default)	8	0 to 255
	unsigned short (option)	16	0 to 65535
QUALITY_FACTOR	unsigned byte	8	0 to 255
RECEIVE_HEAVE	signed byte	8	-128 to 127
DEPTH_ERROR	unsigned short	16	0 to 65535
ACROSS_TRACK_ERROR	unsigned short	16	0 to 65535
ALONG_TRACK_ERROR	unsigned short	16	0 to 65535
QUALITY_FLAGS	unsigned byte	8	0 to 255
BEAM_FLAGS	unsigned byte	8	0 to 255
SIGNAL_TO_NOISE	signed byte	8	-128 to 127
BEAM_ANGLE_FORWARD	signed short	16	-32768 to 32767
VERTICAL_ERROR	unsigned short	16	0 to 65535
HORIZONTAL_ERROR	unsigned short	16	0 to 65535
SECTOR_NUMBER	unsigned byte	8	0 to 255
DETECTION_INFO	unsigned byte	8	0 to 255
INCIDENT_BEAM_ADJUSTEMENT	signed byte	8	-128 to 127
SYSTEM_CLEANING	unsigned byte	8	0 to 255
DOPPLER_CORRECTION	signed byte	8	-128 to 127

Inputs:

`sf` a pointer to the *gsfScaleFactors* structure to be loaded

`subrecordID` the subrecord id for the beam array data

`c_flag` the compression flag for the beam array. This is a bit mask that combines the caller specified field size in the higher order four bits with the lower four bits reserved for future use to specify a compression algorithm. The supported field size values are defined as macros in gsf.h (GSF_FIELD_SIZE_DEFAULT, etc).

`precision` the precision to which the beam array data are to be stored(a value of 0.1 would indicate decimeter precision for depth)

`offset`	the "DC" offset to scale the data by.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_CANNOT_REPRESENT_PRECISION

GSF_TOO_MANY_ARRAY_SUBRECORDS

2.2.7 Function: gsfGetScaleFactor

Usage:

```
int gsfGetScaleFactor(int            handle,
                      int            subrecordID,
                      unsigned char *c_flag,
                      double        *multiplier,
                      double        *offset)
```

Description:

gsfGetScaleFactor is used to obtain the beam array field size, compression flag, multiplier and DC offset values by which each swath bathymetry ping array subrecord is scaled. **gsfGetScalesFactor** is called once for each array subrecord of interest. At least one swath bathymetry ping record must have been read from, or written to, the file specified by handle prior to calling **gsfGetScaleFactor**.

Inputs:

`Handle`	the integer value set by a call to **gsfOpen or gsfOpenBuffered**.
`subrecordID`	an integer value containing the subrecord id of the requested scale factors
`c_flag`	the address of an unsigned character to contain the optional beam array field size in the high order four bits, and the optional compression flag in the low order four bits. If the field size is not specified the default will be used. The high order four bits (beam_array_field_size) will be set to one of the following

	values: GSF_FIELD_SIZE_DEFAULT, GSF_FIELD_SIZE_ONE, GSF_FIELD_SIZE_TWO, or GSF_FIELD_SIZE_FOUR.
`multiplier`	the address of a double to contain the scaling multiplier
`offset`	the address of a double to contain the scaling DC offset.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_ILLEGAL_SCALE_FACTOR_MULTIPLIER

GSF_TOO_MANY_ARRAY_SUBRECORDS

2.2.8 Function: gsfSetDefaultScaleFactor

Usage:

```
int gsfSetDefaultScaleFactor(gsfSwathBathyPing *mb_ping)
```

Description:

gsfSetDefaultScaleFactor is a convenience function used to convert files stored in a vendor format to the gsf format. The function estimates reasonable scale factors for each of the arrays in the ping record. The function will estimate based on the default compression size and set the values of the ping's scale factors. This function requires some overhead as it will perform operations on each beam in each array contained in the ping record.

Inputs:

`mb_ping`	a pointer to the *gsfSwathBathyPing* which contains the beam arrays and will contain the estimated scale factors upon returning from the function.

Returns:

The function returns 0 to indicate success.

Error Conditions:

None.

2.2.9 Function: gsfLoadDepthScaleFactorAutoOffset

Usage:

```
int gsfLoadDepthScaleFactorAutoOffset(gsfSwathBathyPing *ping,
                                      int                subrecordID,
                                      int                reset,
                                      double             min_depth,
                                      double             max_depth,
                                      double            *last_corrector,
                                      char               c_flag,
                                      double             precision)
```

Description:

gsfLoadDepthScaleFactorAutoOffset may be used to load the scale factors for the depth subrecords of the swath bathymetry ping record scale factor structure. The function uses the tide and depth correction fields to help establish the offset component of the scale factor such that negative depth values may be supported. Negative depth values may be encountered when surveying above the tidal datum. In addition, this function may be used for systems mounted on subsea platforms where high depth precision may be supported even in deep water.

Inputs:

`ping`	a pointer to the *gsfSwathBathyPing* which contains the depth and tide correction values, and the scale factors data structure.
`subrecordID`	an integer value containing the subrecord ID for the beam array data; this must be either GSF_SWATH_BATHY_SUBRECORD_DEPTH_ARRAY, or GSF_SWATH_BATHY_SUBRECORD_NOMINAL_DEPTH_ARRAY.
`reset`	an integer value that will cause the internal logic to be refreshed when the value is non-zero; the first call to this function should use a non-zero reset, from then

on, this value may be passed as zero.

`min_depth` — a double value that should be set to the minimum depth value contained in the depth array specified by subrecordID; this argument exists for completeness, but is currently not used.

`max_depth` — a double value that should be set to the maximum depth value contained in the depth array specified by subrecordID; when a depth threshold is exceeded, the offset used to support "signed depth" is no longer required and will no longer be used. This approach is necessary to avoid an integer overflow when the array data are scaled.

`last_corrector` — an address of a double value stored as permanent memory; successive calls to this function must pass the same address for this argument. This function will take care of setting the value at this address, but the caller is responsible for ensuring that the same permanent memory address is used for each call to this function.

`C_flag` — the compression flag for the beam array. This is a bit mask that combines the (optional) caller specified field size in the higher order four bits with the lower four bits reserved for future use to specify a compression algorithm. The supported field size values are defined as macros in gsf.h (GSF_FIELD_SIZE_DEFAULT, etc). See section 2.2.5 on **gsfLoadScaleFactor** for more information.

`precision` — the precision to which the beam array data are to be stored (a value of 0.1 would indicate decimeter precision for depth).

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_UNRECOGNIZED_ARRAY_SUBRECORD_ID

GSF_CANNOT_REPRESENT_PRECISION

GSF_TOO_MANY_ARRAY_SUBRECORDS

2.2.10 Function: gsfGetPositionDestination

Usage:

```
GSF_POSITION gsfGetPositionDestination(GSF_POSITION gp, GSF_POSITION_OFFSETS
offsets, double heading, double dist_step)
```

Description:

This function calculates a destination position using the 'metric' function as an iterative process. The number of iterations is calculated by dividing each offset by the 'dist_step' input and using the largest value. The offsets are then evenly divided by the number of iterations and applied to calculate the final destination position.

Inputs:

`gp`	Reference position (typically ping position, in degrees).
`offsets`	XYZ offsets from the reference position (in meters).
`heading`	Platform heading (in degrees).
`dist_step`	Distance increment used in step-wise calculation to destination.

Returns:

This function returns the destination position.

Error Conditions:

None.

2.2.11 Function: gsfGetPositionOffsets

Usage:

```
GSF_POSITION_OFFSETS gsfGetPositionOffsets(GSF_POSITION gp_from, GSF_POSITION
gp_to, double heading, double dist_step)
```

Description:

This function calculates position offsets from the reference position to the destination position using the 'metric' function as an iterative process. The number of iterations is calculated by dividing the distance between the positions by the 'dist_step' input. The offsets are calculated by applying the number of iterations to the calculation.

Inputs:

`gp_from`	Reference position (in degrees).
`gp_to`	Destination position (in degrees).
`heading`	Platform heading (in degrees).
`dist_step`	Distance increment used in step-wise calculation to destination (typically 5 – 10 meters).

Returns:

This function returns the offsets from the reference position to the destination position.

Error Conditions:

None.

2.2.12 Macro: gsfTestPingStatus

Usage:

```
unsigned short gsfTestPingStatus(ping_flags, usflag)
```

Description:

This function returns the value of a single flag within the `ping_flags` field of the *gsfSwathBathymetry* record

Inputs:

`ping_flags`	The contents of the `ping_flags` field.
`usflag`	An unsigned short integer with a single bit set to identify the flag being tested.

Returns:

This macro returns TRUE if the bit within `ping_flags`, which corresponds to the bit set in `usflags`, is set. Otherwise, the macro returns FALSE.

Error Conditions:

None

2.2.13 Macro: gsfSetPingStatus

Usage:

```
unsigned short gsfSetPingStatus(ping_flags, usflag)
```

Description:

This function sets a bit within the within the `ping_flags` field of the *gsfSwathBathymetry* record

Inputs:

`ping_flags`	The original contents of the `ping_flags` field.
`usflag`	An unsigned short integer with a single bit set to identify the flag to be set.

Returns:

A new copy of the `ping_flags` field with the corresponding bit set.

Error Conditions:

None

2.2.14 Macro: gsfClearPingStatus

Usage:

```
unsigned short gsfClearPingStatus(ping_flags, usflag)
```

Description:

This function clears a bit within the within the `ping_flags` field of the *gsfSwathBathymetry* record.

Inputs:

`ping_flags`	The original contents of the `ping_flags` field.
`usflag`	An unsigned short integer with a single bit set to identify the flag to be cleared.

Returns:

A new copy of the `ping_flags` field with the corresponding bit cleared.

Error Conditions:

None

2.3 Information Functions

Information functions include those that

- decode error conditions,
- return the time associated with a record at a specific location,
- return the location of the file pointer as a percentage of the total file size,
- provide the number and types of records within a file,
- provide information about beam widths of various types of sonar data
- for sonars with two transducers, determine whether a specific data record is from the starboard or port transducer.
- provide the name of the sensor

2.3.1 Function: gsfInterror

Usage:

```
int gsfIntError(void)
```

Description:

This function returns the integer code for the most recent error encountered. Call this function if a -1 is returned from one of the GSF functions.

Inputs:

None

Returns:

The current value of gsfError

Error Conditions:

None

2.3.2 Function: gsfPrintError

Usage:

```
void gsfPrintError(FILE * fp)
```

Description:

This function prints a short message describing the most recent error encountered. Call this function if a -1 is returned from one of the GSF functions.

Inputs:

`fp` a pointer to a FILE to which the message is written.

Returns:

None

Error Conditions:

None

2.3.3 Function: gsfStringError

Usage:

```
char *gsfStringError(void);
```

Description:

This function returns a short message describing the most recent error encountered. Call this function if a -1 is returned from one of the gsf functions.

Inputs:

None

Returns:

Pointer to a string containing the text message.

Error Conditions:

None

2.3.4 Function: gsfIndexTime

Usage:

```
int gsfIndexTime(int     handle,
                 int     record_type,
                 int     record_number,
                 time_t *sec,
                 long   *nsec)
```

Description:

This function returns the time associated with a specified record number and type. It also returns the record number that was read.

Inputs:

`handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`record_type`	record type to be retrieved
`record_number`	record number to be retrieved (Setting this argument to -1 will get the time and record number of the last record of type `record_type`)
`sec`	Seconds since the beginning of the epoch (as defined in the GSF processing parameter record.)
`nsec`	Nanoseconds since the beginning of the second.

Returns:

This function returns the record number if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_FILE_SEEK_ERROR

GSF_INDEX_FILE_READ_ERROR

GSF_RECORD_TYPE_NOT_AVAILABLE

2.3.5 Function: gsfPercent

Usage:

```
int gsfPercent (int handle)
```

Description:

This function returns the location of the file pointer expressed as a percentage of the total file size. It may obtain an indication of how far along a program is in reading a GSF data file. The file size is obtained when the file is opened. If the file is being updated by another program, the value returned will be in error and will reflect the percentage based on the file's size at the time that calling program opened the file.

Inputs:

`handle` gsf file handle assigned by **gsfOpen** or **gsfOpenBuffered**

Returns:

This function returns the current file position as a percentage of the file size, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_TELL_ERROR

2.3.6 Function: gsfGetNumberRecords

Usage:

```
int gsfGetNumberRecords (int handle,
                         int desiredRecord)
```

Description:

This function returns the number of records of a given type. The number of records is retrieved from the index file, so the file must have been opened for direct access (*GSF_READONLY_INDEX*, or *GSF_UPDATE_INDEX*).

Inputs:

`handle`	the handle to the file as provided by **gsfOpen or gsfOpenBuffered**
`desiredRecord`	the desired record or *GSF_NEXT_RECORD*

Returns:

This function returns the number of records of type *desiredRecord* contained in the GSF file designated by handle, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_BAD_ACCESS_MODE

GSF_UNRECOGNIZED_RECORD_ID

2.3.7 Function: gsfGetSwathBathyBeamWidths

Usage:

```
int gsfGetSwathBathyBeamWidths(const gsfRecords *data,
                               double     *fore_aft,
```

```
                                    double      *athwartship)
```

Description:

This function returns to the caller the fore-aft and the port-starboard beam widths in degrees for a swath bathymetry multibeam sonar, given a *gsfRecords* data structure containing a populated *gsfSwathBathyPing* structure.

Inputs:

`data`	The address of a *gsfRecords* data structure maintained by the caller which contains a populated *gsfSwathBathyPing* substructure.
`fore_aft`	The address of a double allocated by the caller which will be loaded with the sonar's fore/aft beam width in degrees. A value of GSF_BEAM_WIDTH_UNKNOWN is used when the beam width is not known.
`athwartship`	The address of a double allocated by the caller which will be loaded with the sonar's athwartship beam width in degrees. A value of GSF_BEAM_WIDTH_UNKNOWN is used when the beam width is not known.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

None.

2.3.8 Function: gsfGetSwathBathyArrayMinMax

Usage:

```
int gsfGetSwathBathyArrayMinMax(const gsfSwathBathyPing *ping,
                                int                 subrecordID,
                                double             *min_value,
                                double             *max_value)
```

Description:

This function returns to the caller the minimum and maximum supportable values for each of the swath bathymetry arrays. The minimum and maximum values are determined based on the scale factors and the array type.

Inputs:

`ping`	The address of a *gsfSwathBathyPing* data structure that contains the depth and tide correction values, as well as the scale factors data structure.
`subrecordID`	The subrecord ID for the beam array data.
`min_value`	The address of a double value allocated by the caller into which will be placed the minimum value that may be represented for this array type.
`max_value`	The address of a double value allocated by the caller into which will be placed the maximum value that may be represented for this array type.

Returns:

This function returns zero if successful, or -1 if an error occurred. *gsfError* is set to indicate the error.

Error Conditions:

GSF_UNRECOGNIZED_ARRAY_SUBRECORD_ID

GSF_ILLEGAL_SCALE_FACTOR_MULTIPLIER

2.3.9 Function: gsfIsStarboardPing

Usage:

```
int gsfIsStarboardPing(const gsfRecords *data)
```

Description:

This function uses the sonar specific portion of a *gsfSwathBathymetry* ping structure to determine if the ping is from the starboard arrays of a multibeam installation with dual transducers.

Inputs:

`data` The address of a *gsfRecords* data structure maintained by the caller containing a populated *gsfSwathBathyPing* substructure.

Returns:

This function returns non-zero if the ping contained in the passed data represents a starboard looking ping from a dual headed sonar installation. Otherwise, zero is returned. If the sonar does not have dual transducers, a value of zero will be returned.

Error Conditions:

None

2.3.10 Function: gsf_register_progress_callback

Usage:

```
void gsf_register_progress_callback(GSF_PROGRESS_CALLBACK progressCB)
```

Description:

This function registers a callback function, defined by the user, to be called to report the progress of the index file creation. If no progress callback is registered, status is printed to stdout if the DISPLAY_SPINNER macro is defined during compilation of the GSF library.

Inputs:

`progressCB` The name of the progress callback function to call when creating the GSF index file. The progress callback will accept two integer arguments, and this function will be called whenever the percent complete changes. This fist argument will be one of the following three values, to represent the state of the progress:

1 = Reading GSF file

2 = Creating new index file

3 = Appending to existing index file

The second argument contains the percent complete of the current state.

Returns:

None

Error Conditions:

None

2.3.11 Function: gsfGetSonarTextName

Usage:

```
char *gsfGetSonarTextName(const gsfSwathBathyPing *ping)
```

Description:

This function returns the name of the sensor based on the sensor id contained in the ping structure.

Inputs:

`Ping`	The address of a *gsfSwathBathyPing* data structure that contains the sensor_id value, as well as the mode value (mode is used for the Reson SeaBat 9001, 9002, and 9003)

Returns:

Pointer to a string containing the sensor name, or “Unknown” if the sensor id is not defined.

Error Conditions:

None

2.3.12 Function: gsfFileSupportsRecalculateXYZ

Usage: `int gsfFileSupportsRecalculateXYZ(int handle, int *status)`

Description: This function reads the GSF file referenced by handle and determines if the file contains sufficient information to support a full recalculation of the platform relative XYZ values from raw measurements. This function rewinds the file to the first record and reads through the file looking for the information required to support a full swath recalculation from raw measurements and supporting navigation, attitude, SVP and installation offset information. On success, the file pointer is reset to the beginning of the file before the function returns.

Inputs:

`handle` GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**

`status` A pointer to an integer allocated by caller into which the function result is placed. `*status` is assigned a value of 1 if this file provides sufficient information to support full recalculation of the platform relative XYZ values, otherwise `*status` is assigned a value of 0.

Returns: This function returns zero if successful or -1 if an error occurred.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_READ_ERROR

GSF_RECORD_SIZE_ERROR

GSF_INSUFFICIENT_SIZE

GSF_CHECKSUM_FAILURE

GSF_UNRECOGNIZED_RECORD_ID

GSF_HEADER_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_SUBRECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.3.13 Function: gsfFileSupportsRecalculateTPU

Usage: `int gsfFileSupportsRecalculateTPU(int handle, int *status)`

Description: This function reads the GSF file referenced by handle and determines if the file contains sufficient information to support calculation of the total propagated uncertainty (TPU) values. This function rewinds the file to the first record and reads through the file looking for the information required to support calculation of vertical and horizontal propagated uncertainty. The total propagated uncertainty arrays are the horizontal_error and the vertical_error beam arrays. On success, the file pointer is reset to the beginning of the file before the function returns.

Inputs:

`Handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`Status`	A pointer to an integer allocated by caller into which the function result is placed. `*status` is assigned a value of 1 if this file provides sufficient information to support calculation of the total propagated uncertainty array values, otherwise `*status` is assigned a value of 0.

Returns: This function returns zero if successful or -1 if an error occurred.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_READ_ERROR

GSF_RECORD_SIZE_ERROR

GSF_INSUFFICIENT_SIZE

GSF_CHECKSUM_FAILURE

GSF_UNRECOGNIZED_RECORD_ID

GSF_HEADER_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_SUBRECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.3.14 Function: gsfFileSupportsRecalculateNominalDepth

Usage: `int gsfFileSupportsRecalculateNominalDepth(int handle, int *status)`

Description: This function reads the GSF file referenced by handle and determines if the file contains sufficient information to support calculation of the nominal depth array. This function rewinds the file to the first record and reads through the file looking for the information required to support calculation of the optional nominal depth array. The nominal depth values represent the depth relative to a sound speed of 1500 meters second. On success, the file pointer is reset to the beginning of the file before the function returns.

Inputs:

`handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`status`	A pointer to an integer allocated by caller into which the function result is placed. `*status` is assigned a value of 1 if this file provides sufficient information to support calculation of the nominal depth array, otherwise `*status` is assigned a value of 0.

Returns: This function returns zero if successful or -1 if an error occurred.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_READ_ERROR

GSF_RECORD_SIZE_ERROR

GSF_INSUFFICIENT_SIZE

GSF_CHECKSUM_FAILURE

GSF_UNRECOGNIZED_RECORD_ID

GSF_HEADER_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_SUBRECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.3.15 Function: gsfFileContainsMBAmplitude

Usage: `int gsfFileContainsMBAmplitude(int handle, int *status)`

Description: This function reads the GSF file referenced by handle and determines if the file contains the average per receive beam amplitude data. This function rewinds the file to the first record and reads through the file up to and including the first ping record. If amplitude data are contained in the first ping record it is assumed that amplitude data are contained with all ping records in this file. On success, the file pointer is reset to the beginning of the file before the function returns.

Inputs:

`handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`status`	A pointer to an integer allocated by caller into which the function result is placed. `*status` is assigned a value of 1 if this file contains the optional per-receive-beam average amplitude beam array, otherwise `*status` is assigned a value of 0.

Returns: This function returns zero if successful or -1 if an error occurred.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_READ_ERROR

GSF_RECORD_SIZE_ERROR

GSF_INSUFFICIENT_SIZE

GSF_CHECKSUM_FAILURE

GSF_UNRECOGNIZED_RECORD_ID

GSF_HEADER_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_SUBRECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.3.16 Function: gsfFileContainsMBImagery

Usage: `int gsfFileContainsMBImagery(int handle, int *status)`

Description: This function reads the GSF file referenced by handle and determines if the file contains the per-receive-beam imagery time series data. This function rewinds the file to the first record and reads

through the file up to and including the first ping record. If MB imagery data are contained in the first ping record it is assumed that MB imagery data are contained with all ping records in this file. On success, the file pointer is reset to the beginning of the file before the function returns.

Inputs:

`handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`status`	A pointer to an integer allocated by caller into which the function result is placed. `*status` is assigned a value of 1 if this file contains the optional per-receive-beam imagery time series data, otherwise `*status` is assigned a value of 0.

Returns: This function returns zero if successful or -1 if an error occurred.

Error Conditions:

GSF_BAD_FILE_HANDLE

GSF_FILE_SEEK_ERROR

GSF_FLUSH_ERROR

GSF_READ_TO_END_OF_FILE

GSF_PARTIAL_RECORD_AT_END_OF_FILE

GSF_READ_ERROR

GSF_RECORD_SIZE_ERROR

GSF_INSUFFICIENT_SIZE

GSF_CHECKSUM_FAILURE

GSF_UNRECOGNIZED_RECORD_ID

GSF_HEADER_RECORD_DECODE_FAILED

GSF_SVP_RECORD_DECODE_FAILED

GSF_PROCESS_PARAM_RECORD_DECODE_FAILED

GSF_SENSOR_PARAM_RECORD_DECODE_FAILED

GSF_COMMENT_RECORD_DECODE_FAILED

GSF_HISTORY_RECORD_DECODE_FAILED

GSF_NAV_ERROR_RECORD_DECODE_FAILED

GSF_ATTITUDE_RECORD_DECODE_FAILED

GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED

GSF_SUMMARY_RECORD_DECODE_FAILED

GSF_UNRECOGNIZED_SUBRECORD_ID

GSF_INVALID_RECORD_NUMBER

GSF_RECORD_TYPE_NOT_AVAILABLE

GSF_INDEX_FILE_READ_ERROR

2.3.17 Function: gsfIsNewSurveyLine

Usage: `int gsfIsNewSurveyLine (int handle, const gsfRecords *rec, double azimuth_change, double *last_heading)`

Description: This function provides an approach for calling applications to determine if the last ping read from a GSF file is from the same survey transect line, or if the last ping is from a newly started survey line. The implementation looks for a change in platform heading to determine that the last ping read is from a new survey line. External to this function, calling applications can decide on their own if the first ping read from a newly opened GSF file should be considered to be from a new survey transect line or not. This function assumes that the GSF file is read in chronological order from the beginning of the file, file access can be either direct or sequential

Inputs:

`handle`	GSF file handle assigned by **gsfOpen** or **gsfOpenBuffered**
`rec`	The address of a *gsfRecords* data structure maintained by the caller which contains a populated *gsfSwathBathyPing* substructure obtained from recent call to gsfRead.
`azimuth_change`	A trigger value set by the calling application to be used as the threshold for detecting the end heading change associated with the end of a survey line.
`last_heading`	The address of a double allocated by the calling that is set by gsfIsNewSurveyLine when a new line is detected. The application program should allocate this double such that it's memory persists for all calls to gsfIsNewSurveyLine. The function depends on this value persisting from one call to the next.

Returns: This function returns zero when ping is not considered to be from a new survey line and non-zero when the ping is considered to be from a new survey line.

Error Conditions:

None.

2.3.18 Function: gsfInitializeMBParams

Usage: `int gsfInitializeMBParams (gsfMBParams *p)`

Description: This function provides way to initialize all the sonar processing parameters to “unknown”.

Inputs:

`p`	pointer to the *gsfMBParams* data structure which will be populated with “unknown”

Returns:

None.

Error Conditions:

None.

3. ERROR CODE DESCRIPTIONS

Any GSF function that returns an error code also sets the value of *gsfError* before returning. Table 3-1 lists the reasons for error. **gsfPrintError** or **gsfStringError** can be used to generate a text string of the reason for the error.

Note that the current version of GSFlib does provide text string translations for all error code returns; however, not all definitions have unique values. A future release will address this issue. Table 3-1 presents all the reasons supported by gsfPrintError. The following table is a complete listing of all error return codes.

Table 3-1 GSF Error Codes

Value of gsfError	Value	Reason for error
GSF_ATTITUDE_RECORD_DECODE_FAILED	-50	"GSF Error decoding attitude record"
GSF_ATTITUDE_RECORD_ENCODE_FAILED	-49	
GSF_BAD_ACCESS_MODE	-3	"GSF Error illegal access mode"
GSF_BAD_FILE_HANDLE	-24	"GSF Error bad file handle"
GSF_BAD_SEEK_OPTION	-15	"GSF Error unrecognized file seek option"
GSF_CANNOT_REPRESENT_PRECISION	-22	"GSF Error illegal scale factor multiplier specified"
GSF_CHECKSUM_FAILURE	-8	"GSF Error data checksum failure"
GSF_COMMENT_RECORD_DECODE_FAILED	-30	"GSF Error decoding comment record"
GSF_COMMENT_RECORD_ENCODE_FAILED	-30	
GSF_CORRUPT_INDEX_FILE_ERROR	-37	"GSF Error index file is corrupted, delete index file"
GSF_FILE_CLOSE_ERROR	-9	"GSF Error closing gsf file"
GSF_FILE_SEEK_ERROR	-16	"GSF Error file seek failed"
GSF_FILE_TELL_ERROR	-35	"GSF Error file tell failed"
GSF_FLUSH_ERROR	-34	"GSF Error flushing data buffers(s)"
GSF_FOPEN_ERROR	-1	"GSF Unable to open requested file"
GSF_HEADER_RECORD_DECODE_FAILED	-25	"GSF Error decoding header record"
GSF_HEADER_RECORD_ENCODE_FAILED	-25	
GSF_HISTORY_RECORD_DECODE_FAILED	-31	"GSF Error decoding history record"
GSF_HISTORY_RECORD_ENCODE_FAILED	-31	
GSF_HV_NAV_ERROR_RECORD_DECODE_FAILED	-48	"GSF Error decoding horizontal/vertical navigation error record"
GSF_HV_NAV_ERROR_RECORD_ENCODE_FAILED	-47	"GSF Error encoding horizontal/vertical navigation error record"

GSF_ILLEGAL_SCALE_FACTOR_MULTIPLIER	-21	"GSF Error illegal scale factor multiplier specified"
GSF_INDEX_FILE_OPEN_ERROR	-36	"GSF Error open of index file failed"
GSF_INDEX_FILE_READ_ERROR	-44	"GSF Error index file read error"
GSF_INSUFFICIENT_SIZE	-6	"GSF Error insufficient size specified"
GSF_INVALID_NUM_BEAMS	-42	"GSF Error invalid number of beams"
GSF_INVALID_RECORD_NUMBER	-43	"GSF Error invalid record number"
GSF_MB_PING_RECORD_DECODE_FAILED	-26	"GSF Error decoding multibeam ping record"
GSF_MB_PING_RECORD_ENCODE_FAILED	-26	
GSF_MEMORY_ALLOCATION_FAILED	-12	"GSF Error memory allocation failure"
GSF_NAV_ERROR_RECORD_DECODE_FAILED	-32	"GSF Error decoding latitude/longitude navigation error record"
GSF_NAV_ERROR_RECORD_ENCODE_FAILED	-32	
GSF_NORMAL	0	
GSF_OPEN_TEMP_FILE_FAILED	-51	"GSF Failed to open temporary file for index creation"
GSF_PARAM_SIZE_FIXED	-45	"GSF Error unable to update existing file with increased record size"
GSF_PARTIAL_RECORD_AT_END_OF_FILE	-52	"GSF Error corrupt/partial record at end of the file"
GSF_PROCESS_PARAM_RECORD_DECODE_FAILED	-28	"GSF Error decoding processing parameters record"
GSF_PROCESS_PARAM_RECORD_ENCODE_FAILED	-28	
GSF_READ_ERROR	-4	"GSF Error reading input data"
GSF_READ_TO_END_OF_FILE	-23	"GSF End of file encountered"
GSF_RECORD_SIZE_ERROR	-7	"GSF Error record size is out of bounds"
GSF_RECORD_TYPE_NOT_AVAILABLE	-39	"GSF Error requested indexed record type not in gsf file"
GSF_SCALE_INDEX_CALLOC_ERROR	-38	"GSF Error calloc of scale factor index memory failed"
GSF_SENSOR_PARAM_RECORD_DECODE_FAILED	-29	"GSF Error decoding sensor parameters record"
GSF_SENSOR_PARAM_RECORD_ENCODE_FAILED	-29	
GSF_SETVBUF_ERROR	-33	"GSF Error setting internal file buffering"
GSF_SINGLE_BEAM_ENCODE_FAILED	-46	"GSF Error single beam encode failure"

GSF_STREAM_DECODE_FAILURE *****Note: error code is not used**	-14	"GSF Error stream decode failure"
GSF_SUMMARY_RECORD_DECODE_FAILED	-40	"GSF Error decoding summary record"
GSF_SUMMARY_RECORD_ENCODE_FAILED	-41	"GSF Error encoding summary record"
GSF_SVP_RECORD_DECODE_FAILED	-27	"GSF Error decoding SVP record"
GSF_SVP_RECORD_ENCODE_FAILED	-27	
GSF_TOO_MANY_ARRAY_SUBRECORDS	-10	"GSF Error too many array subrecords"
GSF_TOO_MANY_OPEN_FILES	-11	"GSF Error too many open files"
GSF_UNRECOGNIZED_ARRAY_SUBRECORD_ID	-19	"GSF Error unrecognized array subrecord id "
GSF_UNRECOGNIZED_DATA_RECORD	-18	"GSF Error unrecognized data record id"
GSF_UNRECOGNIZED_FILE	-2	"GSF Error unrecognized file"
GSF_UNRECOGNIZED_RECORD_ID	-13	"GSF Error unrecognized record id"
GSF_UNRECOGNIZED_SENSOR_ID	-17	"GSF Error unrecognized sensor specific subrecord id"
GSF_UNRECOGNIZED_SUBRECORD_ID	-20	"GSF Error unrecognized subrecord id"
GSF_WRITE_ERROR	-5	"GSF Error writing output data"
GSF_QUALITY_FLAGS_DECODE__ERROR	-53	"GSF error decoding quality flags record"
Unrecognized error condition		"GSF unknown error"

4. C-LANGUAGE DEFINITIONS OF STRUCTURES USED BY GSFLIB

GSFlib is built upon several complex data structures that are passed to applications using the library to access data. This section describes these complex data structures.

4.1 Definition of GSF Data Records

Eleven data records define GSF data. Subsequent sections define each of these records. The gsfRecords structure allows all records to be addressed as a unit.

```
typedef struct t_gsfRecords
{
    gsfHeader               header;
    gsfSwathBathySummary    summary;
    gsfSwathBathyPing       mb_ping;
    gsfSingleBeamPing       sb_ping;
    gsfSVP                  svp;
    gsfProcessingParameters process_parameters;
    gsfSensorParameters     sensor_parameters;
    gsfComment              comment;
    gsfHistory              history;
    gsfNavigationError      nav_error;
    gsfHVNavigationError    hv_nav_error;
    gsfAttitude             attitude;
} gsfRecords;
```

4.1.1 Header Record

A header record is required to be the first record of every GSF data file.

```
#define GSF_VERSION_SIZE 12
typedef struct t_gsfHeader
{
    char         version[GSF_VERSION_SIZE];
}
gsfHeader;
```

4.1.2 Swath Bathymetry Ping Record

```
typedef struct t_gsfSwathBathyPing

{
    struct timespec   ping_time;           /* seconds and nanoseconds */
    double            latitude;            /* in degrees, north is positive */
    double            longitude;           /* in degrees, west is positive */
    double            height;              /* height above ellipsoid */

                                                                        Sidescan */
    t_gsfR2SonicImagerySpecific      gsfR2SonicImagerySpecific;      /* used for R2Sonic
                                                                        */
} gsfSensorImagery;
```

4.1.3 Single-beam Bathymetry Record

```
/* Define a single beam record structure */
typedef struct t_gsfSingleBeamPing
{
    struct timespec ping_time;              /* Time the sounding was made */
    double       latitude;                  /* latitude (degrees) of sounding */
```

```
    double       longitude;                /* longitude (degrees) of sounding */
    double       tide_corrector;           /* in meters */
    double       depth_corrector;          /* in meters, draft corrector for sensor */
    double       heading;                  /* in degrees */
    double       pitch;                    /* in meters */
    double       roll;                     /* in meters */
    double       heave;                    /* in meters */
    double       depth;                    /* in meters */
    double       sound_speed_correction;    /* in meters */
    unsigned short  positioning_system_type;
    int          sensor_id;
    gsfSBSensorSpecific sensor_data;
}
gsfSingleBeamPing;
```

Note that while GSF maintains both read and write support for the Single-Beam record definition, users are actively discouraged from using this record. The preferred means of saving single beam data is to use the gsfSwathBathyPing record definition, with the number_beams field set to one.

4.1.3.1 Single-beam Sensor-specific Subrecords

```
/* Define the Echotrac Single-Beam sensor specific data structure. */
typedef struct t_gsfEchotracSpecific
{
    int                   navigation_error;
    unsigned short        mpp_source;         /* Flag To determine if nav was mpp */
    unsigned short        tide_source;
}
t_gsfEchotracSpecific;

/* Define the MGD77 Single-Beam sensor specific data structure. */
typedef struct t_gsfMGD77Specific
{
    unsigned short  time_zone_corr;
```

```
    unsigned short  position_type_code;
    unsigned short  correction_code;
    unsigned short  bathy_type_code;
    unsigned short  quality_code;
    double travel_time;
}
t_gsfMGD77Specific;

/* Define the BDB sensor specific data structure */
typedef struct t_gsfBDBSpecific

    char           *command_line;
    char           *comment;
}
gsfHistory;
```

4.1.9 Navigation Error Record

Note: As of GSF v1.07, the *gsfNavigationError* record has been replaced by *gsfHVNavigationError*. All newly created files should be written using *gsfHVNavigationError*, instead of *gsfNavigationError.*

```
typedef struct t_gsfNavigationError    /* obsolete, as of GSF v1.07 */
{
    struct timespec nav_error_time;
    int             record_id;         /* Containing nav with these errors */
```

```
    double          latitude_error;     /* 90% CE in meters */
    double          longitude_error;    /* 90% CE in meters */
}
gsfNavigationError;

typedef struct t_gsfHVNavigationError
{
    struct timespec nav_error_time;
    int             record_id;          /* Containing nav with these errors */
    double          horizontal_error;   /* RMS error in meters */
    double          vertical_error;     /* RMS error in meters */
    double          SEP_uncertainty;    /* RMS error in meters */
    char            spare[2];           /* Two bytes reserved for future use */
    char           *position_type;      /* 4 character string code specifying type of
                                           positioning system */
}
gsfHVNavigationError;
```

4.1.10 Swath Bathymetry Summary Record

```
typedef struct t_gsfSwathBathySummary
{
    struct timespec start_time;
    struct timespec end_time;
    double          min_latitude;
    double          min_longitude;
    double          max_latitude;
    double          max_longitude;
    double          min_depth;
    double          max_depth;
}
gsfSwathBathySummary;
```

4.1.11 Attitude Record

```
typedef struct t_gsfAttitude
{
    short            num_measurements;      /* number of attitude measurements in this
record */
    struct timespec *attitude_time;         /* seconds and nanoseconds */
    double          *pitch;                 /* in degrees */
    double          *roll;                  /* in degrees */
    double          *heave;                 /* in meters */
    double          *heading;               /* in degrees */
}
gsfAttitude;
```

4.2 Supporting Data Structures and Definitions

4.2.1 Record Identifier

```
typedef struct t_gsfDataID
{
    int          checksumFlag;   /* boolean */
    int          reserved;       /* up to 9 bits */
    int          recordID;       /* bits 00-11 => data type number */
                                 /* bits 12-22 => registry number */
    int          record_number;  /* specifies the nth occurrence of */
                                 /* record type specified by recordID */
                                 /* relavent only for direct access */
                                 /* the record_number counts from 1 */
}
gsfDataID;
```

4.2.2 Time Structure

```
struct timespec
```

```
    {
       time_t        tv_sec;
       long          tv_nsec;
    };
```

4.2.3 Null values used to represent missing data

```
/* Define null values to be used for missing data */
#define GSF_NULL_LATITUDE               91.0
#define GSF_NULL_LONGITUDE              181.0
#define GSF_NULL_HEADING                361.0
#define GSF_NULL_COURSE                 361.0
